Lab 6: Motion Detection

frameDifference:

detectChanges with a threshold of 50:

detectChanges with a threshold of 60:

detectChanges with a threshold of 75:

Of the three values I tested (50, 60 and 75), I think the threshold value of 50 works best with detectChanges. I think that an even lower value than 50 would work better maybe 40 or 35. The reason I say this is that all three of them have detected the person in the photo, but too much of the person is getting erased which means the threshold value is too high.
